

Assignment 3

- 1- Removing elements from numeric arrays causes missing indexes:
Write a script to **reset the array indexes**. (You can use any predefined functions)
- 2- Write a function **getPriceWithDiscount** that takes the price and returns the price after discount.
 - discount is 10% for prices greater than 1000
 - and 5% for prices less than or equal 1000
- 3- Create function calculates **the factorial** of a given number **using recursion**. (recursion not loop)
- 4- Create a form take product data from user (name, type of product, price) by **get** method, fetch and echo this data **above the form**.

name	type	price	Submit
-----------------------------------	-----------------------------------	------------------------------------	---------------------------------------

- 5- Create a form take a data of two products
[product 1 => (name, type, price), product 2 => (name, type, price, offer)] by **post** method.
Fetch the data in handle and store it in array after that echo the two product with all data **in handle page**.

product 1	
name	
type	
price	

product 2	
name	
type	
price	
offer	
Submit	

- 6- Create a **register** form take a data from user (name, email, phone, age, password) with **post** method, fetch the data in handle and store it in array but hash the password, after that echo the data **in handle page**.

register	
name	
email	
phone	
age	
password	
Submit	

- 7- Create a **login** form take a data from user (email , password) with post method , fetch the data **in handle**, and write a static data (email , password) in handle then compare the data from user and the static data if the data is the same data echo welcome else echo error.

login	
email	
password	
Submit	

8- Write a script **add-product.php** containing a **form** to add new product

- Form inputs:
 - name: text
 - description: textarea
 - price: number
- Form is submitting a POST request to script **handle-add-product.php**
The handle file contains the following:
Validate the inputs by rules
 - name → required | string | min:5 | max:255
 - description → optional | string
 - price → required | number | min:0
- if not valid then **display errors**
- else then print data (name - description if exists - price - price after discount using the function getPriceWithDiscount **from question 2**)

9- Images Drive

A simple drive that allows the user to **upload/download** images.

The exercise has **two pages**:

- Upload page: contains a form with two inputs (image file input - text input to set the name of the image **if he wants to rename it to a specific name**)
- Index page: **displays** all stored images, each image must have a **download link**.

Hint:

You may use the scandir() function to get all file names in your uploads folder.

https://www.w3schools.com/php/func_directory_scandir.asp

10- Simple calculator

Create a file **"calculator.php"** with a form containing:

- First number input
- Second number input
- Select dropdown for operation (+, -, *, /)
- Submit button

In the same page, if form is submitted:

- Display the calculation result
- Example: "5 + 3 = 8"
- If division by zero, show error message
- Use POST method
